Hot take: if your AI agent can take irreversible actions without asking a human, you've built a demo, not a product.

SWIPE ->

I added human-in-the-loop approval gates to Tank, and it changed how I think about agents.

An agent that can read, search and summarize is low risk. An agent that can send emails, change records or spend money is a different thing entirely.

My rule now: any action you can't undo gets a pause. The agent proposes, a human approves, then it runs.

The objection is that approvals slow things down and defeat the point of automation. That's fair, and for low-stakes workflows I'd agree.

But the cost of one wrong irreversible action usually outweighs the time saved on a thousand right ones.

The design question isn't "should agents be autonomous?" It's "which actions earn autonomy, and how do they earn it?"

Where do you draw the line for your agents?
