How I used AI to build an AI framework

SWIPE ->

When I started building Tank, I let Claude write a lot of the early code.

It scaffolded the ASGI core, the provider-agnostic LLM client, the @tool decorator, the agent loop and the SSE streaming format. I moved fast.

Then something shifted. By the later phases (parallel tool execution, tiered memory, RAG, approval gates), I was writing the code myself. Claude moved into a different role: architectural review and PR feedback.

Here's what I learned:

AI is great at the first 30% of a project, where the patterns are well known and speed matters.

It's more valuable in the last 70% as a reviewer than as a writer. That's where the decisions are subtle and you need to understand every line.

The risk of letting AI write everything is that you ship code you can't debug. The fix is simple: once the foundation exists, write the hard parts yourself and use AI to challenge them.

How are you splitting work between yourself and AI on your projects?
